

Medicare Part B Drug Step Therapy List

Effective: January 1st, 2025

Medicare Part B Step Therapy is a program designed to ensure that you receive effective and cost-efficient medications covered by your plan. It works by starting your treatment with a specific medication that's chosen by your insurance provider as the first option. This initial medication is often a lower-cost or preferred drug.

Medicare Part B covers some drugs such as injections you receive in a doctor's office, some oral anti-cancer drugs, medications used with durable medical equipment, immunosuppressant drugs, among others. In some cases, the plan requires a Step therapy to cover some Part B medications.

What does Step Therapy mean?

Step therapy is a utilization tool that requires you to first try another drug to treat your medical condition before we cover the drug that is not preferred. Trying a different drug first encourages you to try a less costly, but just as effective drug before the plan covers another drug. For example, if Drug A and Drug B treat the same medical condition and Drug A is less costly, the plan may require you to try Drug A first. If Drug A does not work for you, the plan will then cover Drug B.

Drug Class / Indication(s)	Preferred Drug(s)	Non-Preferred Drug(s)
Vascular Endothelial Growth Factor Inhibitor (ophthalmic)	- Byooviz - Lucentis - Eylea	- Cimerli - Beovu - Vabysmo
